

# Succulent Instructions

## Water

These succulents don't need a lot of water! A thorough watering every 2-4 weeks is plenty.

Succulents are usually thirsty in hot summer months, but can go several weeks between watering in winter (their dormant season).

Check the soil every few weeks - if it's totally dried out, go ahead and water. If not - hold off! Overwatering these plants is the worst thing!

## Light

Succulents thrive in hot places with plenty of sunshine. A sunny windowsill is the best place for these plants! Your plant will be happy with indirect filtered light for at least 4-6 hours daily.

If your space is very dimly lit and there's no sunny window, consider watering less frequently. If there's too much outdoor sunlight, they may get burned.

Succulents have a tendency to stretch if it's too dark, so if you see elongated growth, try to move your plant to a brighter location.

## Fertilizer

Fertilizing isn't necessary, but can help slow-growing succulents get bigger more quickly than watering alone. A general purpose 20-20-20 fertilizer will do the trick. Cut it to 1/4th strength and use with every watering from March - Mid September.
